

UNIWEBPASS

The web solution for managing
your access control remotely

Unipass, our access control system, benefits from its own web module: UniwebPass.

Through an innovative, user-friendly web interface, this collaborative tool allows you to control access to the zones, resources and/or equipment in your premises.

Each web client depends on the main server. This gives you local access to all the key functions of a high-performance access control system: instant control over doors and readers, access monitoring, report production, allocation of temporary cards... Useful for taking steps quickly if problems arise.

On the basis of predefined criteria, you can generate a variety of reports to help you analyse the data collected.

Since UniwebPass is an Internet application, it only needs to be installed once on the server. It is then available to any member of staff with an Internet connection and authorisation to use the application.

Wherever you are and whatever you are doing, all you need is an Internet connection and you can view activity in your buildings in real time: who is accessing what, when!

WHY UNIWEBPASS?

- Easily and remotely control all of your buildings via one centralised web solution
- Visualise in real time all movements and/all activities within your buildings
- Dynamic and customisable interface
- Simple, fast updates: IDtech Update can update all your clients
- Simplified evacuation list management
- Report generation

WHY A WEB PLATFORM?

- Ease of use
- Solution easily extendable
- Portable (multiplatform)
- Mobile: any PC equipped with a navigator can become a client
- Easy implementation of consultation terminals
- Improved reliability of shared information
- Direct data monitoring both at the central and local level
- No upgrade procedures: all changes are implemented directly on the server and immediately available to users
